

Importing ticket data

To migrate issue tickets from other issue-tracking systems into Trac or perform housekeeping actions on tickets or simply synchronize different databases, there are some tools, plugins and scripts available.

TicketImportPlugin

?TicketImportPlugin: a plugin that lets you import or update into Trac a series of tickets from a **CSV file** or (if the ?xlrd library is installed) from an **Excel spreadsheet**.

ExportImportXlsPlugin

?ExportImportXlsPlugin: a plugin that adds an admin panel for exporting and importing tickets via **XLS file**. Requires the python packages xlwt/rxld.

Bugzilla

?BugzillaIssueTrackingPlugin: a plugin that integrates Bugzilla issue data into Trac keeping TracLinks. Ticket data can be imported from Bugzilla using the ?bugzilla2trac.py script, available in the contrib/ directory of the Trac distribution.

```
bugzilla2tracpy
bugzilla2trac  Imports a bug database

Usage bugzilla2tracpy options

Available Options
db MySQL dbname          Bugzilla
tracenv pathtotracenv    full path to Trac db environment
h host MySQL hostname    Bugzilla
u user MySQL username    effective Bugzilla
p passwd MySQL password  Bugzilla
c clean                  remove current Trac tickets before importing
help help                this help info

Additional configuration options can be defined directly the script
```

Currently, the following data is imported from Bugzilla:

- bugs
- bug activity (field changes)
- bug attachments
- user names and passwords (put into an htpasswd file)

The script provides a number of features to ease the conversion, such as:

- **PRODUCT_KEYWORDS**: Trac has no concept of products, so the script provides the ability to attach a ticket keyword instead.
- **IGNORE_COMMENTS**: Don't import Bugzilla comments that match a certain regexp.
- **STATUS_KEYWORDS**: Attach ticket keywords for the Bugzilla statuses not available in Trac. By default, the `VERIFIED` and `RELEASED` Bugzilla statuses are translated into Trac keywords.

For more details on the available options, see the configuration section at the top of the script.

Jira

?JiraToTracIntegration: a plugin that provides tools to import Atlassian Jira backup files into Trac. The plugin consists of a Python 3.1 commandline tool that:

- Parses the Jira backup XML file.
- Sends the imported Jira data and attachments to Trac using the ?XmlRpcPlugin.
- Generates a htpasswd file containing the imported Jira users and their SHA-512 base64 encoded passwords.

Mantis

?MantisImportScript: a script to import the following type of data from Mantis into Trac:

- bugs
- bug comments
- bug activity (field changes)
- attachments (as long as the files live in the mantis database, not on the filesystem).

PlanetForge

?PlanetForgeImportExportPlugin: this plugin exports Trac data (wiki, tickets, compoments, permissions, repositories, etc.) using the open format designed by the ?COCLICO project. It extends the webadmin panel and the 'trac admin ...' command. Has no 'import' feature.

Scarab

?ScarabToTracScript: a script that migrates Scarab issues to Trac tickets. Requires ?XmlRpcPlugin.

Sourceforge

?SfnToTracScript: importer of SourceForge's new backup file (originated from #Trac3521). Also, ticket data can be imported from Sourceforge using the ?sourceforge2trac.py script, available in the contrib/ directory of the Trac distribution.

Other

Since Trac uses a SQL database to store the data, you can also custom-import from other systems by examining the database tables. Just go into ?sqlite command line to look at the tables and import them from your application.

Comma delimited file - CSV

See ?csv2trac.2.py for details. This approach is particularly useful if you need to enter a large number of tickets by hand. Note that the ticket type type field, (task etc.) is also needed for this script to work with more

recent Trac releases.

Comments on script: The script has an error on line 168: 'Ticket' needs to be 'ticket'. Also, the listed values for severity and priority are swapped.
