

## Wiki Processors

Processors are [WikiMacros](#) designed to provide alternative markup formats for the [Wiki engine](#). Processors can be thought of as *macro functions to process user-edited text*.

Wiki processors can be used in any Wiki text throughout Trac, such as:

- [syntax highlighting](#) or for rendering text verbatim
- rendering [Wiki markup inside a context](#), like inside `<div>` blocks or `<span>` or within `<td>` or `<th>` table cells
- using an alternative markup syntax, like [raw HTML](#) and [Restructured Text](#) or [■textile](#)

## Using Processors

To use a processor on a block of text, first delimit the lines using a Wiki *code block*:

```
{{{
The lines
that should be processed...
}}}
```

Immediately after the `{{{` or on the line just below, add `#!` followed by the *processor name*:

```
{{{
#!processorname
The lines
that should be processed...
}}}
```

This is the "shebang" notation, familiar to most UNIX users.

Besides their content, some Wiki processors can also accept *parameters*, which are then given as `key=value` pairs after the processor name and on the same line. If `value` has to contain space, as it's often the case for the `style` parameter, a quoted string can be used (`key="value with space"`).

As some processors are meant to process Wiki markup, it's quite possible to *nest* processor blocks. You may want to indent the content of nested blocks for increased clarity, this extra indentation will be ignored when processing the content.

## Examples

Wiki Markup	Display
<b>Example 1:</b> Inserting raw HTML	
<pre>{{{ #!html &lt;hl style="color: grey"&gt;This is raw HTML&lt;/hl&gt; }}}</pre>	This is raw HTML
<b>Example 2:</b> Highlighted Python code in a <code>&lt;div&gt;</code> block with custom style	
<pre>{{{#!div style="background: #ffd; border: 3px ridge"  This is an example of embedded "code" block:  {{{ #!python def hello():     return "world" }}} }}}</pre>	<div>This is an example of embedded "code" block:</div> <pre>def hello():     return "world"</pre>
<b>Example 3:</b> Searching tickets from a wiki page, by keywords.	
<pre>{{{ #!html &lt;form action="/query" method="get"&gt;&lt;div&gt; &lt;input type="text" name="keywords" value="" size="30"/&gt; &lt;input type="submit" value="Search by Keywords"/&gt; &lt;!-- To control what fields show up use hidden fields &lt;input type="hidden" name="col" value="id"/&gt; &lt;input type="hidden" name="col" value="summary"/&gt; &lt;input type="hidden" name="col" value="status"/&gt; &lt;input type="hidden" name="col" value="milestone"/&gt; &lt;input type="hidden" name="col" value="version"/&gt; &lt;input type="hidden" name="col" value="owner"/&gt; &lt;input type="hidden" name="col" value="priority"/&gt; &lt;input type="hidden" name="col" value="component"/&gt; --&gt; &lt;/div&gt;&lt;/form&gt; }}}</pre>	

## Available Processors

The following processors are included in the Trac distribution:

<code>#!default</code>	Present the text verbatim in a preformatted text block. This is the same as specifying <i>no</i> processor name (and no <code>#!</code> ).
<code>#!comment</code>	Do not process the text in this section, i.e. contents exist only in the plain text - not in the rendered page.
<code>#!rtl</code>	Introduce a Right-To-Left block with appropriate CSS direction and styling. ( <i>since 0.12.2</i> )
<b>HTML related</b>	
<code>#!html</code>	Insert custom HTML in a wiki page.
<code>#!htmlcomment</code>	Insert an HTML comment in a wiki page. ( <i>since 0.12</i> )
	Note that <code>#!html</code> blocks have to be <i>self-contained</i> , i.e. you can't start an HTML element in one block and close it later in a second block. Use the following processors for achieving a similar effect.
<code>#!div</code>	Wrap wiki content inside a <code>&lt;div&gt;</code> element.
<code>#!span</code>	Wrap wiki content inside a <code>&lt;span&gt;</code> element.
<code>#!td</code>	Wrap wiki content inside a <code>&lt;td&gt;</code> element. ( <i>since 0.12</i> )
<code>#!th</code>	Wrap wiki content inside a <code>&lt;th&gt;</code> element. ( <i>since 0.12</i> )
<code>#!tr</code>	Can optionally be used for wrapping <code>#!td</code> and <code>#!th</code> blocks, either for specifying row attributes or better visual grouping. ( <i>since 0.12</i> )
<code>#!table</code>	Can optionally be used for wrapping <code>#!tr</code> , <code>#!td</code> and <code>#!th</code> blocks, for specifying table attributes. One current limitation however is that tables cannot be nested. ( <i>since 0.12</i> )
	See <a href="#">WikiHtml</a> for example usage and more details about these processors.
<b>Other Markups</b>	
<code>#!rst</code>	Trac support for Restructured Text. See <a href="#">WikiRestructuredText</a> .
<code>#!textile</code>	Supported if <a href="#">Textile</a> is installed. See <a href="#">a Textile reference</a> .
<b>Code Highlighting Support</b>	
<code>#!c</code> <code>#!cpp</code> (C++) <code>#!python</code> <code>#!perl</code> <code>#!ruby</code> <code>#!php</code> <code>#!asp</code> <code>#!java</code> <code>#!js</code> (Javascript) <code>#!sql</code> <code>#!xml</code> (XML or HTML) <code>#!sh</code> (Bourne/Bash shell) <b>etc.</b>	<p>Trac includes processors to provide inline syntax highlighting for source code in various languages.</p> <p>Trac relies on <a href="#">Pygments</a> for syntax coloring.</p> <p>See <a href="#">TracSyntaxColoring</a> for information about which languages are supported and how to enable support for more languages.</p>

Since 1.1.2 the default, coding highlighting and MIME-type processors support the argument `lineno` for adding line numbering to the code block. When a value is specified, as in `lineno=3`, the numbering will start at the specified value. When used in combination with the `lineno` argument, the `marks`

argument is also supported for highlighting lines. A single line number, set of line numbers and range of line numbers are allowed. For example, `marks=3`, `marks=3-6`, `marks=3,5,7` and `marks=3-5,7` are all allowed. The specified values are relative to the numbered lines, so if `lineno=2` is specified to start the line numbering at 2, `marks=2` will result in the first line being highlighted.

Using the MIME type as processor, it is possible to syntax-highlight the same languages that are supported when browsing source code.

MIME Type Processors																																																		
Some examples:	The result will be syntax highlighted HTML code:																																																	
<pre>{{{#!text/html&lt;h1&gt;text&lt;/h1&gt;}}}</pre>	<pre>&lt;h1&gt;text&lt;/h1&gt;</pre> <p>The same is valid for all other <a href="#">mime types supported</a>.</p>																																																	
	<p><b>#!diff</b> has a particularly nice renderer:</p> <p><a href="#">Version</a></p> <table><tr><td></td><td></td><td>name='TracHelloWorld',</td></tr><tr><td>115</td><td>115</td><td>version='1.0',</td></tr><tr><td></td><td></td><td>packages=find_packages(exclud</td></tr><tr><td>116</td><td>116</td><td></td></tr><tr><td>117</td><td></td><td>entry_points = ""</td></tr><tr><td>118</td><td></td><td>[trac.plugins]</td></tr><tr><td></td><td></td><td>helloworld =</td></tr><tr><td>119</td><td></td><td>myplugins.helloworld</td></tr><tr><td>120</td><td></td><td>""</td></tr><tr><td></td><td>117</td><td>entry_points = {</td></tr><tr><td></td><td>118</td><td>'trac.plugins': [</td></tr><tr><td></td><td>119</td><td>'helloworld =</td></tr><tr><td></td><td></td><td>myplugins.helloworld',</td></tr><tr><td></td><td>120</td><td>],</td></tr><tr><td></td><td>121</td><td>},</td></tr><tr><td>121</td><td>122</td><td>)</td></tr></table>				name='TracHelloWorld',	115	115	version='1.0',			packages=find_packages(exclud	116	116		117		entry_points = ""	118		[trac.plugins]			helloworld =	119		myplugins.helloworld	120		""		117	entry_points = {		118	'trac.plugins': [		119	'helloworld =			myplugins.helloworld',		120	],		121	},	121	122	)
		name='TracHelloWorld',																																																
115	115	version='1.0',																																																
		packages=find_packages(exclud																																																
116	116																																																	
117		entry_points = ""																																																
118		[trac.plugins]																																																
		helloworld =																																																
119		myplugins.helloworld																																																
120		""																																																
	117	entry_points = {																																																
	118	'trac.plugins': [																																																
	119	'helloworld =																																																
		myplugins.helloworld',																																																
	120	],																																																
	121	},																																																
121	122	)																																																

Line numbers can be added to code blocks and lines can be highlighted (*since 1.1.2*).

<pre>{{{#!python lineno=3 marks=3,9-10,16 def expand_markup(stream, ctxt=None):     """A Genshi stream filter for expanding `genshi.Markup` events.      Note: Expansion may not be possible if the fragment is badly     formed, or partial.     """     for event in stream:         if isinstance(event[1], Markup):             try:                 for subevent in HTML(event[1]):                     yield subevent             except ParseError:                 yield event         else:             yield event }}}</pre>
--

For more processor macros developed and/or contributed by users, visit the [■Trac Hacks](#) community site.

Developing processors is no different from Wiki macros. In fact, they work the same way, only the usage syntax differs. See [WikiMacros#DevelopingCustomMacros](#) for more information.
